**Field of the invention :**

5 The needs of anti-cancer therapy call for the constant development of new anti-proliferative agents, with the aim of obtaining medicaments that are both more active and better tolerated. The compounds of the present invention exhibit in particular anti-tumour properties, which accordingly render them useful in the treatment of cancers. Among the types of cancer that can be treated with the compounds of the present invention there may be mentioned, without implying any limitation, adenocarcinomas and carcinomas,

**EXAMPLE 54 : 2-(3-hydroxypropyl)-5-methyl-1*H*-dipyrrolo[3,4-*a*:3,4-*c*]carbazole-1,3,4,6(2*H*,5*H*,7*H*)-tetrone**

The expected product is obtained in accordance with the procedure described in Example 6, with the replacement of N,N-diethylethylenediamine by 3-amino-1-propanol.

**EXAMPLE 55 : 2-(3-methoxypropyl)-5-methyl-1*H*-dipyrrolo[3,4-*a*:3,4-*c*] carbazole-1,3,4,6(2*H*,5*H*,7*H*)-tetrone**

The expected product is obtained in accordance with the procedure described in Example 6, with the replacement of N,N-diethylethylenediamine by 3-methoxypropylamine.

**PHARMACOLOGICAL STUDY OF THE COMPOUNDS OF THE INVENTION**

**EXAMPLE 56 *In vitro* activity**

Three cell lines were used :

- *L1210 murine leukaemia*
- *A549 non-small-cell human lung carcinoma*
- *DU145 prostate carcinoma*

L1210 murine leukaemia was used *in vitro*. The cells are cultured in RPMI 1640 complete culture medium containing 10 % foetal calf serum, 2mM glutamine, 50 units/ml of

penicillin, 50 µg/ml of streptomycin and 10mM Hepes, pH : 7.4. The cells are distributed on microplates and are exposed to the cytotoxic compounds for 4 doubling periods, or 48 hours. The number of viable cells is then quantified by a colorimetric assay, the Microculture Tetrazolium Assay (J. Carmichael *et al.*, Cancer Res.; 47, 936-942 (1987)).

5 The results are expressed as the IC<sub>50</sub>, the concentration of cytotoxic agent that inhibits the proliferation of the treated cells by 50 %. By way of example, the compound of Example 2 exhibits IC<sub>50</sub> values of 6.8 µM on L1210, 4.7 µM on A549 and 5.4 µM on DU 145.
